

Hyprrland Cheat-Sheet

Hyprrland keybinding cheat-sheet

Mod key = **Super** (Windows key)

Apps

Key	Action
Super + Q	Open terminal (Ghostty)
Super + R	App launcher (wofi)
Click `(bar, bottom-left)` App launcher (wofi) - same as Super + R Super + E File manager (Nautilus, GUI) Super + Shift + E File manager (yazi, terminal) Super + Shift + L Lock screen (hyprlock) Super + O Toggle Ollama scratchpad (wide ghostty, qwen2.5-coder:7b) — hides, doesn't kill	

Windows

Key	Action
Super + C	Put away focused window (hides it, doesn't kill)
Super + Shift + C	Bring back the put-away window
Super + Shift + Q	Close (kill) focused window
Super + V	Toggle floating
Super + F	Toggle fullscreen
Super + P	Toggle pseudotile
Super + J	Toggle split direction
Super + H/J/K/L or arrows	Move focus between windows
Super + drag (left click)	Move window
Super + drag (right click)	Resize window
Video fullscreen in Chrome (e.g. YouTube f)	Fills the tile, not the monitor (window rule)

Workspaces

Key	Action
Super + 1..0	Switch to workspace 1-10
Super + Shift + 1..0	Move focused window to workspace 1-10
Super + scroll	Cycle workspaces
3-finger touchpad swipe	Switch workspaces

Media / system

Key	Action
Volume up/down/mute keys	Adjust/mute volume (wpctl)
Brightness up/down keys	Adjust screen brightness
Play/next/prev media keys	playerctl control

Bar (waybar — bottom of screen)

Element	Click action
“ home button	App launcher (wofi)
Workspace numbers	Switch workspace
Network	nm-connection-editor
Bluetooth	blueman-manager
Volume	Toggle mute
CPU / Mem	htop

Desktop widgets

Three floating windows are launched at startup and pinned in place (wallpaper owns the center of the screen):
| Widget | Position | Contents | |—|—|—| | System monitor | left | **btop** | | System info | top-right | **fastfetch** |
| | Ascii art | bottom-right | static art from `~/.config/hypr/ascii-art.txt` |

Close/move like any floating window (**Super** + **Shift** + **Q** to kill / **Super** + **drag** to move) — they won't reappear positioned until the next Hyprland login.

Session

Key	Action
Super + M	Exit Hyprland, back to GDM

Terminal apps

Command	Action
y	yazi (in any terminal) — <code>cds</code> to wherever you exited
yazi	yazi without the <code>cd-on-exit</code> behavior

Other apps (via **Super** + **R**)

- **Google Chrome** — web browser
- **Prism Launcher** — Minecraft (Flatpak); use `dgpu-run flatpak run org.prismlauncher.PrismLauncher` to force NVIDIA dGPU
- **Papers** — PDF viewer

yazi keybinds

Key	Action
j / k or arrows	Move down / up
h / l or arrows	Parent dir / enter dir
H / L	Back / forward in history
gg / G	Top / bottom
gh	Go home (~)
gc	Go to ~/.config
gd	Go to ~/Downloads
<Space>	Toggle selection on current file
v / V	Visual select mode / visual unset mode
Ctrl+a / Ctrl+r	Select all / invert selection
y / x / p / P	Yank (copy) / cut / paste / paste (overwrite)
d / D	Trash / permanently delete
a	Create file (end with / for a directory)
r	Rename
o / Enter	Open
O / Shift+Enter	Open interactively (pick app)
.	Toggle hidden files
/ / ?	Find next / previous
s / S	Search by name (fd) / by content (ripgrep)
f	Filter files
tt	New tab in current dir
1-9	Switch to tab N
[/]	Previous / next tab
, then m/a/s/e/n	Sort by mtime / alphabetical / size / extension / natural (Shift = reverse)
w	Task manager
~ or F1	Help (full keymap, searchable)
q	Quit

GPU offload

Run any app on the NVIDIA dGPU instead of the AMD iGPU (Hyprland always runs on AMD, since it drives the panel):

```
dgpu-run <command>
# e.g.
dgpu-run flatpak run org.prismlauncher.PrismLauncher
```

Recovery

- **Hyprland won't start / crashes at login:** at GDM, switch to a TTY with Ctrl+Alt+F3, log in, run `journalctl --user -b -u wayland-wm@hyprland.service` or check `~/.local/share/hyprland/ /run/user/$UID/hypr*/hyprland.log` for the actual error. Ctrl+Alt+F1 (or F2) back to the graphical screen.
- **Session hung:** `loginctl terminate-user cross` from a TTY force-kills it and drops GDM back to the login screen.
- **Just want GNOME back:** Super + M from inside Hyprland, or pick “GNOME” instead of “Hyprland” at the GDM session picker. GNOME is Nord-themed with a bottom taskbar (dash-to-panel); if it ever looks stock or broken after an upgrade, re-run `gnome-nord`.
- **Config errors on screen:** `hyprctl configerrors` gives the exact file/line instead of guessing from the on-screen banner.
- **Cropped/shifted screen:** see Troubleshooting in README.md — almost always a fractional monitor scale.
