

GNOME Desktop Cheat-Sheet

GNOME desktop cheat-sheet

Windows-like GNOME setup: dash-to-panel taskbar (bottom), ArcMenu start menu, per-window Alt-Tab, edge snapping. All of it is applied by the `gnome-nord` script – re-run it and re-login if anything looks stock.

Start menu & apps

Key	Action
Super	Open start menu (ArcMenu, Windows layout)
Type after Super	Search apps/files, Enter to launch
Alt + F2	Run-command prompt (GNOME built-in)
Taskbar icon click	Focus/launch app (pin via right-click)

There are no custom app-launch hotkeys anymore (the old **Super+Q** etc. went with Hyprland). Add any you miss in Settings > Keyboard > Custom Shortcuts.

Windows

Key	Action
Alt + Tab	Switch between windows (Windows-style, per window)
Super + Tab	Switch between applications (grouped)
Super + Left/Right	Snap window to half screen (or drag to edge)
Super + Up	Maximize (or drag to top edge)
Super + Down	Unmaximize / restore
Super + H	Minimize (“hide”)
Alt + F4	Close window
F11	Fullscreen (app-dependent)

Workspaces

Key	Action
Super + Page Up / Page Down	Previous / next workspace
Super + Shift + Page Up / Page Down	Move window to prev/next workspace
3-finger touchpad swipe up	Overview (all windows + workspaces)

Media / system

Volume, brightness, and media keys are handled natively by GNOME. System menu (network, bluetooth, battery, power off): top-right of the taskbar. Lock screen: **Super + L**.

Terminal apps

Command	Action
y	yazi (in any terminal) – cds to wherever you exited
yazi	yazi without the cd-on-exit behavior

yazi keybinds

Key	Action
j / k or arrows	Move down / up
h / l or arrows	Parent dir / enter dir
H / L	Back / forward in history
gg / G	Top / bottom
gh	Go home (~)
gc	Go to ~/.config
gd	Go to ~/Downloads
<Space>	Toggle selection on current file
v / V	Visual select mode / visual unset mode
Ctrl+a / Ctrl+r	Select all / invert selection
y / x / p / P	Yank (copy) / cut / paste / paste (overwrite)
d / D	Trash / permanently delete
a	Create file (end with / for a directory)
r	Rename
o / Enter	Open
O / Shift+Enter	Open interactively (pick app)
.	Toggle hidden files
/ / ?	Find next / previous
s / S	Search by name (fd) / by content (ripgrep)
f	Filter files
tt	New tab in current dir
1-9	Switch to tab N
[/]	Previous / next tab
, then m/a/s/e/n	Sort by mtime / alphabetical / size / extension / natural (Shift = reverse)
w	Task manager
~ or F1	Help (full keymap, searchable)
q	Quit

GPU offload

Run any app on the NVIDIA dGPU instead of the AMD iGPU (GNOME always runs on AMD, since it drives the panel):

```
dgpu-run <command>
# e.g.
dgpu-run flatpak run org.prismlauncher.PrismLauncher
```

WiFi

GNOME's system menu (top-right of the taskbar) lists and connects to networks. The `wifi` script still works from any terminal:

```
wifi                # interactive picker
wifi "GC Public"    # connect straight to a named network
```

Saved networks reconnect without a prompt; new ones ask for a password. On a captive portal you'll associate but have no route out until you open any `http://` page and sign in.

Recovery

- **GNOME session won't start / crashes at login:** at GDM, switch to a TTY with `Ctrl+Alt+F3`, log in, check `journalctl --user -b -u org.gnome.Shell@wayland.service` (or `journalctl -b -p err`). `Ctrl+Alt+F1` (or `F2`) back to the graphical screen.
- **Session hung:** `loginctl terminate-user cross` from a TTY force-kills it and drops back to the GDM login screen.
- **Theme/taskbar/start menu missing or stock-looking:** re-run `gnome-nord`, then log out/in. If `ArcMenu` is gone entirely (e.g. after a GNOME major upgrade breaks compatibility), reinstall the matching version from `extensions.gnome.org` (`gnome-extensions install <zip>`).
- **Desperate fallback:** pick “GNOME Classic” at the GDM session picker (gear icon) – ugly but always works. Normal logins should use plain “GNOME”; Classic force-loads its own extensions and fights this setup.
